

First-Order Low/Highpass Filter Design

Yangang Cao

February 13, 2019

Definition of low/highpass filter:

- **Lowpass (LP)** filters select low frequencies up to the cut-off frequency f_c and attenuate frequencies higher than f_c .
- **Highpass (HP)** filters select high frequencies higher than f_c and attenuate frequencies below f_c .

A first-order lowpass/highpass filter can be achieved by adding or subtracting (+/-) the output signal from the input signal of a first-order allpass filter

$$H(z) = \frac{1}{2}(1 \pm A(z)) \quad (LP/HP + / -)$$

$$A(z) = \frac{z^{-1} + c}{1 + cz^{-1}}$$

$$c = \frac{\tan(\pi f_c/f_S) - 1}{\tan(\pi f_c/f_S) + 1}.$$

Block diagram of first-order low/highpass filter:

The difference equations of first-order lowpass filter are

$$x(n) = u(n) - cx(n-1)$$

$$y(n) = \frac{1+c}{2}x(n) + \frac{1-c}{2}x(n-1),$$

and corresponding state and output equations are

$$x(n) = -cx(n-1) + u(n)$$

$$y(n) = \frac{1-c^2}{2}x(n-1) + \frac{1+c}{2}u(n).$$

Matlab code:

```
1 function y = aplowpassunit(audio, para)
2 % Applies a lowpass filter to the input signal.
3 % para is the normalized cut-off frequency in ...
   (0,1)
4 c = (tan(pi*para/2)-1) / (tan(pi*para/2)+1);
5 x = 0;
6 x_1 = 0;
7 for n = 1:length(audio)
8     x_1 = -c * x + audio(n);
9     y(n) = ((1-c^2)/2) * x + (1+c)/2 * audio(n);
10    x = x_1;
11 end
```

The difference equations of first-order highpass filter are

$$x(n) = u(n) - cx(n-1)$$

$$y(n) = \frac{1-c}{2}x(n) + \frac{c-1}{2}x(n-1)$$

and corresponding state and output equations are

$$x(n) = -cx(n-1) + u(n)$$

$$y(n) = \frac{c^2-1}{2}x(n-1) + \frac{1-c}{2}u(n)$$

Matlab code:

```
1 function y = ahighpassunit(audio, para)
2 % Applies a highpass filter to the input signal.
3 % para is the normalized cut-off frequency in ...
   (0,1)
4 c = (tan(pi*para/2)-1) / (tan(pi*para/2)+1);
5 x = 0;
6 x_1 = 0;
7 for n = 1:length(audio)
8     x_1 = -c * x + audio(n);
9     y(n) = ((c^2-1)/2) * x + (1-c)/2 * audio(n);
10    x = x_1;
11 end
```
